## **NAME**

curl\_multi\_remove\_handle - remove an easy handle from a multi session

## **SYNOPSIS**

#include <curl/curl.h>

CURLMcode curl\_multi\_remove\_handle(CURLM \*multi\_handle, CURL \*easy\_handle);

## **DESCRIPTION**

Removes a given easy\_handle from the multi\_handle. This will make the specified easy handle be removed from this multi handle's control.

When the easy handle has been removed from a multi stack, it is again perfectly legal to invoke  $curl\_easy\_perform()$  on this easy handle.

Removing a handle while being used, will effectively halt all transfers in progress.

### **RETURN VALUE**

CURLMcode type, general libcurl multi interface error code.
